Ubayd Hattas

Cape Town, South Africa | uhattas@gmail.com | ubayd.me | github.com/ubayd-hattas | linkedin.com/in/ubayd-hattas

SUMMARY

First-year Computer Science, Statistics & Data Science student at the University of Cape Town. I build and maintain SA Data Hub, a public South African data platform (Next.js, TypeScript, PostgreSQL, Python), and have taken part in Apart Research sprints on AI evaluation and incident response. Looking for internships and research collaborations in data engineering, machine learning and AI evaluation.

EDUCATION

University of Cape Town *Cape Town*

BSc Computer Science, Statistics & Data Science | 2026 to 2029 (expected)

Trafalgar High School *Cape Town*

National Senior Certificate, 2025 | Top-five achiever, Top Achiever in Mathematics and in Physical Sciences (school awards)

PROJECTS

SA Data Hub *Sole developer | May 2026 to present*

sadatahub.tech | Next.js, TypeScript, Tailwind, Recharts, PostgreSQL (Neon), Python, Vitest, Vercel

- Built and maintain a public platform for South African statistics: 9 province and 213 municipality pages from Census 2022, charts of economic, crime and education indicators, and 12 downloadable CSV datasets.
- Designed the PostgreSQL schema (4 migrations, 13 tables) and wrote Python adapters that pull data from Stats SA, SARB, SAPS and the World Bank.
- Built a staged-publishing workflow: new data is staged first, and the promotion script refuses to write to production until a version is approved.
- Wrote 18 test files, a public methodology page, per-dataset source links and an update log.

Evidence Before Erasure *Team of five | Apart x CeSIA AI Incident Response Sprint, 2026*

Python (standard library only) | github.com/ubayd-hattas/AI_Incident

- Benchmarked periodic snapshot collection against an event-driven policy for preserving evidence from a live AI incident trace. Wrote parts of the experiment runner, performance fixes and integrity checks; co-author of the report.
- The primary contrast was a null result (0 of 23 held-out critical items). The report states it, and the process by which it was obtained, in full.

AfriGuard: Multilingual AI Safety Benchmark *Team of four | Global South AI Safety Hackathon, Cape Town, June 2026*

Python, Pandas, Streamlit | github.com/ubayd-hattas/AfriGuard

- Co-built a benchmark of 40 seed prompts across four South African harm categories, in six languages plus English, run against four models (1,120 responses). Built the Streamlit analytics dashboard and result summaries.
- Scoring used an English-only refusal heuristic, so no attack success rate is claimed; validated, native-speaker scoring is the next step.

Research and hackathon team entries *2026*

- Digital Minds Research Sprint (Apart Research, team of two): tested whether an LLM predicting its own output beats a cheap outside observer. Across 9,269 trials, a one-feature "pick the longer reply" rule (0.808) outperformed Hermes-3 self-prediction (0.719).
- Hack4Dev Data Science Hackathon (team entry): Madrid to Amsterdam building-age classification from Landsat data; class-conditional CORAL raised zero-shot macro-F1 from 0.36 to 0.65 on the team's internal evaluation.

Personal website *ubayd.me*

- Next.js and Tailwind portfolio with a technical blog, structured data and Search Console setup.

SKILLS

Languages: Python, TypeScript, JavaScript, SQL
Web and tools: Next.js, React, Tailwind CSS, Node.js, Streamlit, Vitest, Git/GitHub, Vercel
Data: PostgreSQL, Pandas, ETL pipelines, Recharts, LLM evaluation, experiment design

LEADERSHIP

Head Boy, Trafalgar High School *2025*

- Represented the student body to school leadership; tutored junior Mathematics learners during breaks.
